Can a healthy mouth help create a healthy body?

Researchers continue to find evidence that suggests good oral health may positively impact many medical conditions.¹ So it's important to brush and floss every day, and to see your dentist regularly.

The Mouth and Body Connection

- More than 120 diseases can show early symptoms in the mouth.²
- Evidence shows a strong association between periodontal (gum) disease and heart disease, stroke, diabetes, poor pregnancy outcomes and other conditions.¹
- A mouth free of gum disease may promote an overall healthier body.¹

Healthy Smile, Healthy You®

Healthy Smile, Healthy You is a program that addresses the following health issues:

- Diabetes*
- Pregnancy**
- High-risk cardiac conditions*
- Cancer treatment**
- Weakened immune systems**
- Kidney failure or dialysis**

If you have one of the above conditions, *Healthy Smile, Healthy You* allows for an additional cleaning and exam[†] beyond your plan limit, per benefit period.

To get started, download the *Healthy Smile, Healthy You* registration form located on the Subscriber page at DeltaDentalVA.com.

*Additional cleaning. **Additional cleaning and fluoride application. [†]You may be eligible for an additional periodontal maintenance procedure if you have a history of periodontal treatment, such as surgery.

Once you submit the form, you can schedule your additional appointment with your dentist.

Keep Diabetes in Check

Increased sugar levels may have a negative impact on oral health by increasing the severity of existing gum disease and may lead to tooth loss. Diabetics who have gum disease may find it more difficult to control sugar levels than diabetics who do not have gum problems, because infections may lead to increased blood sugar levels.¹

Healthier Baby

Pregnant women with gum disease may be more likely to have a baby born prematurely or underweight than pregnant women without gum disease.³ Research indicates that labor-inducing biological fluid is found in oral bacteria. This fluid increases with gum disease and has been associated with a higher risk of pre-term, low-birth weight babies.⁴ Additionally, research shows that women with high levels of tooth decay causing bacteria are more likely to pass those onto their newborns increasing their risk for early childhood caries.⁵

Keep Your Heart Healthier

Cardiovascular or heart disease impacts a large number of Americans. And people with gum disease have nearly double the risk for heart disease. Infection causing bacteria may enter the bloodstream, increasing the risk of inflammation and lead to the buildup of fatty plaque in the heart's blood vessels. These fatty proteins then build up and thicken the

walls of the arteries, leading to restricted blood flow. This may then lead to a heart attack or stroke.⁶

Reduce Side Effects of Cancer Treatment

Radiation and chemotherapy may lead to many debilitating oral conditions. Both can have direct effects on salivary glands and oral tissues resulting in increased risk for oral pain, infections and cavities. Research has shown these side effects may be reduced or even avoided with diligent oral care and participation by a dental team during cancer treatment.⁷

Avoid Complications of Weakened Immune Systems

Oral complications can increase treatment costs and disease rates in individuals with weakened immune systems. Even common conditions such as dry mouth and dental decay can be indicators of more serious problems. Associated medical conditions can include rheumatoid arthritis, lupus, multiple sclerosis, Crohn's disease and more.

Reduce Side Effects of Dialysis

Studies have shown that individuals with kidney disease have a higher likelihood of periodontal (gum) disease and tooth loss, and that the severity of these oral health issues is typically related to the level of kidney dysfunction. Treatments such as kidney dialysis, draw off excess fluid which could increase dry mouth and the risk of tooth decay.
